Summary

artec technologies AG, a provider of audiovisual solutions for media monitoring, sets new standards in the industry with its latest development.

Message

Diepholz (prsafe) September 9, 2023 - artec technologies AG, a provider of audiovisual solutions for media monitoring, sets new standards in the industry with its latest development: an AI-driven, multilingual speech recognition (Speech-to-text, S2T) with integrated translation function.

The innovation developed by artec technologies opens up completely new perspectives for international media analysis and at the same time leads to a considerable relief of the user's work processes. The XENTAURIX Media Platform enables the almost real-time reading of TV, radio and webcast program from all over the world in their own target language. This new development brings broadcasters, press and news agencies, digital publishers, security forces, crisis center as well as financial and economic sectors into a new era of news processing.

News broadcasts and features can be followed in real time with low latency as a transcript in the desired target language. The platform records everything so that transcribed video clips can be created and shared during or after a broadcast. This is particularly invaluable for current events. The speech-to-text application works autonomously and does not require an external service provider. With support for more than 50 source languages and up to 30 target languages, taking into account spelling and grammar rules, this application is rewriting the way media content is analysed, processed and documented.

The XENTAURIX platform is available as an in-house system or cloud service and offers maximum flexibility. It can simultaneously process from a few to thousands of channels. artec technologies AG will present its new AI solution and other innovations at the international broadcast trade fair IBC in Amsterdam from 15 to 18 September 2023.
